

CS 4770 Natural Language Processing (Fall 2025)

Slido: <https://app.sli.do/event/7bJLvDqEaxootUccp44pSa>

Yu Meng
University of Virginia
yumeng5@virginia.edu

Aug 27, 2025

Course Information & Logistics

- Course Website: <https://yumeng5.github.io/teaching/2025-fall-cs4770>
- Instructor: **Yu Meng** (yumeng5@virginia.edu)
 - Office hour: After class Mondays & Wednesdays
- TAs (meet them next Monday!):
 - **Wei-Lin Chen** (wlchen@virginia.edu) Office hour: 5:00pm - 6:00pm every Thursday
 - **Zhepei Wei** (zhepei.wei@virginia.edu) Office hour: 4:00pm - 5:00pm every Wednesday
 - **Xinyu Zhu** (xinyuzhu@virginia.edu) Office hour: 2:00pm - 3:00pm every Tuesday
 - All TA office hours are on Zoom (links on the course website)
- Time: Mondays & Wednesdays 2:00pm - 3:15pm
- Location: Mechanical Engr Bldg 205

Lecture Zoom Options & Recordings

- We provide Zoom options for attending lectures remotely
- Recordings will be available after the lecture

Upcoming Meetings Previous Meetings Cloud Recordings

Start Time	Topic
Wed, Aug 27 (Recurring) 2:00 PM	25F Natural Language Processing
Mon, Sep 1 (Recurring) 2:00 PM	25F Natural Language Processing
Wed, Sep 3 (Recurring) 2:00 PM	25F Natural Language Processing

Q&A Format

- Q&A during lecture: Slido (link shared in each lecture & on the course website)
 - Efficient for a big class
 - Good for quick/short questions
 - Allows asking questions anonymously
 - TAs will answer the questions in real time
- Q&A after lecture: Piazza (accessible via Canvas)
 - Assignments/projects
 - Long questions
 - TAs & instructor will answer the questions on a daily basis
- You are encouraged to answer the questions asked by your classmates (participation credit)!

Prerequisites

- Prerequisites:
 - Linear algebra (APMA 3080 or equivalent)
 - Data structures and algorithms (CS 3100)
- Highly recommended background:
 - Deep learning & machine learning (CS 4774)
 - Experience with Python (we'll use **PyTorch** extensively for assignments)
- This class will move fast & cover lots materials! Make sure you have sufficient background before taking it!

Why & Why Not Take This Course

- Why take this course
 - You are passionate to understand how NLP methods/models (LLMs) work
 - You want to find a job that involves using NLP models/tools
 - You are willing to spend much time in this course
- Why not take this course
 - You do not have sufficient background/have little time this semester for this course
 - You are only interested in the latest developments/research perspectives of GenAI – take a graduate-level course (e.g., CS 6770 NLP)
 - You only want to use NLP models/methods to get good results for your interested applications – just use GPT-5/Claude/Gemini
 - Please drop ASAP if it doesn't fit your plan to take to give seats to students in the waitlist
- If you are on the waitlist
 - Wait for open seats when someone drops
 - Attend the lectures and complete the course requirements as if you are registered
 - You'll be guaranteed a spot if you complete Assignment 1 (to be released next Monday)

Grading

- **Assignments (60%)**
 - Five assignments (with different weights) for the entire semester
 - All assignments are to be completed individually
 - Assignments will be a combination of concept questions + coding questions
 - Submission via Canvas (as LaTeX reports; handwritten submissions not accepted)
 - We'll provide HPC access for GPU-related assignments/projects (instructions later)
- Late day policy:
 - 7 free days for **all** assignments; afterwards 20% off grade of the assignment per day late
 - You cannot use > 3 late days (72 hours) per assignment unless given permission in advance
 - DO NOT procrastinate on assignments! The coding questions (esp. the latter part of this course) take time to implement and run!
- Policy on using LLMs:
 - Collaborative coding with LLMs is allowed, but if you directly copy the answers generated by LLMs (for either conceptual or coding questions), you'll get a 0 for that entire assignment

Grading

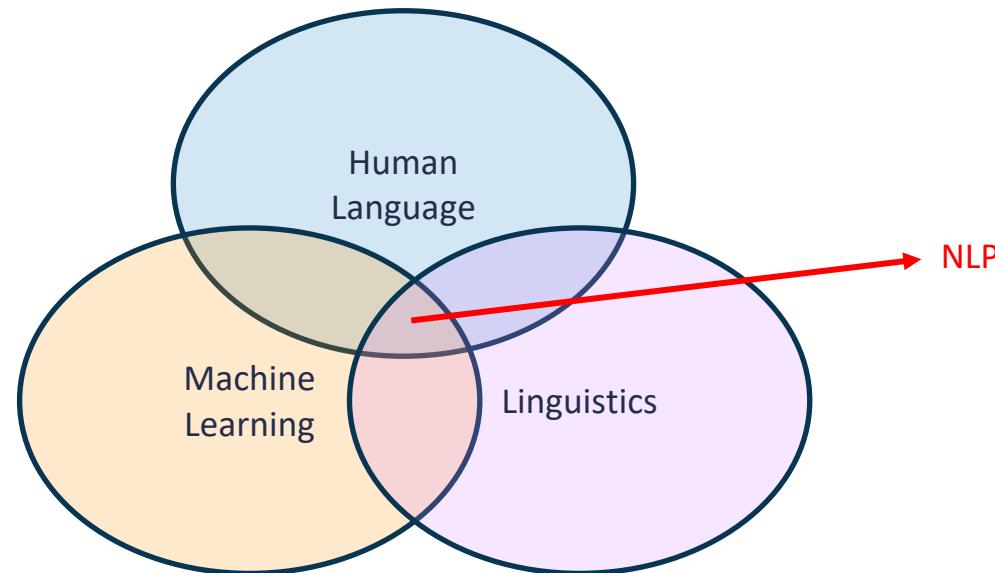

- **Project (35%)**
 - Work in teams of 2–3 students
 - Related to NLP
 - Rule of thumb: demonstrate that you are able to apply the knowledge learned from this course; workload should be more extensive than individual assignments
- Some example project choices:
 - Use word embeddings to analyze sentence semantics (e.g., sentiment analysis)
 - Fine-tune BERT and evaluate its performance for any task you like
 - Benchmark LLMs (either open-weights or proprietary) for challenging tasks
 - Use LLM APIs to create agents for an interesting application (e.g., personal assistants)
 - ...
- Checkpoints (No late dates allowed!)
 - (2%) Project proposal **Deadline:** 09/24
 - (8%) Midterm report **Deadline:** 10/20
 - (25%) Final project presentation **Deadline:** 11/30 + final report **Deadline:** 12/13

Grading

- **Participation (5%+; points earned beyond 5% will become extra credit)**
 - Guest lecture attendance (6%)
 - End-of-semester teaching feedback (2%)
 - Answering **technical** questions raised by classmates (5%)
- Guest lecture attendance on Zoom (6%)
 - We will have 2 guest lectures delivered by leading researchers
 - Each guest lecture can give you up to 3% participation credit (2% attendance + 1% asking questions – more details shared before guest lectures)
- End-of-semester teaching feedback (2%)
 - At the end of the semester, anyone who completes the teaching feedback survey will get 2%
- Answering **technical** questions raised by classmates (5%)
 - We encourage and appreciate help from students to answer questions posted by classmates
 - Every helpful answer to **technical** questions will earn 1% (Slido and Piazza both count)
 - If you answer anonymously, we won't be able to track your contributions!
 - The maximum credit you can get in this category is 5%

What is Natural Language Processing (NLP)?

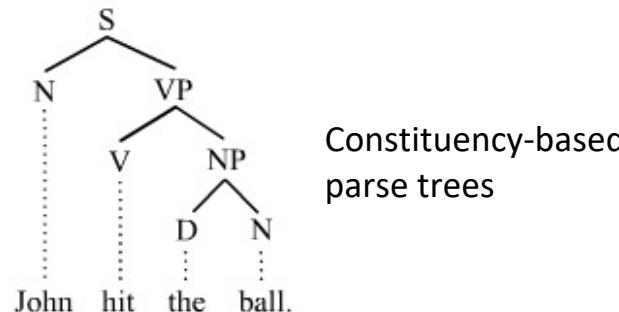

- An interdisciplinary subfield of machine learning and linguistics
- Goal: Enable computers to understand, interpret, and generate human language

The History of NLP

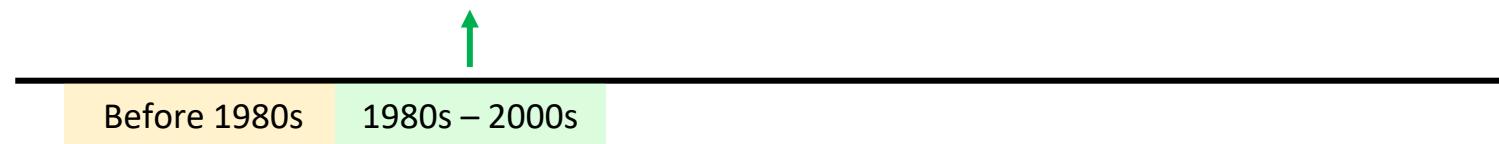

Linguistic-rule based methods
(e.g., syntactic pattern matching)

Before 1980s

The History of NLP

Statistical methods
(e.g., n-gram models, hidden state models)

Language Modeling

- The core problem in NLP is **language modeling**
- Goal: Assigning probability to a sequence of words
- For text understanding: $p(\text{"The cat is on the mat"}) \gg p(\text{"Truck the earth on"})$
- For text generation: $p(w \mid \text{"The cat is on the"}) \rightarrow \text{"mat"}$

Autocomplete empowered by
language modeling

Language Modeling: Probability Decomposition

- Given a text sequence $\mathbf{x} = [x_1, x_2, \dots, x_n]$, how can we model $p(\mathbf{x})$?
- Assumption: the probability of each word only depends on its previous tokens

$$p(\mathbf{x}) = p(x_1)p(x_2|x_1)p(x_3|x_1, x_2) \cdots p(x_n|x_1, \dots, x_{n-1}) = \prod_{i=1}^n p(x_i|x_1, \dots, x_{i-1})$$

- Challenge: hard to keep track of all previous tokens!

N-gram Language Model: Simplified Assumption

- Instead of keeping track of all previous tokens, assume the probability of a word is only dependent on the previous N-1 words
 - Unigram LM: each word's probability does not depend on previous tokens
 - Bigram LM: each word's probability is based on the previous word
 - Trigram LM: each word's probability is based on the previous two words
- $p(\text{"The cat is on the mat"})$
 - $= p(\text{"The"}) p(\text{"cat"}) p(\text{"is"}) p(\text{"on"}) p(\text{"the"}) p(\text{"mat"})$ – Unigram
 - $= p(\text{"The"}) p(\text{"cat"} | \text{"The"}) p(\text{"is"} | \text{"cat"}) p(\text{"on"} | \text{"is"}) p(\text{"the"} | \text{"on"}) p(\text{"mat"} | \text{"the"})$ – Bigram
 - $= p(\text{"The"}) p(\text{"cat"} | \text{"The"}) p(\text{"is"} | \text{"The cat"}) p(\text{"on"} | \text{"cat is"}) p(\text{"the"} | \text{"is on"}) p(\text{"mat"} | \text{"on the"})$ – Trigram

Why Is NLP Challenging?

Semantic ambiguity!

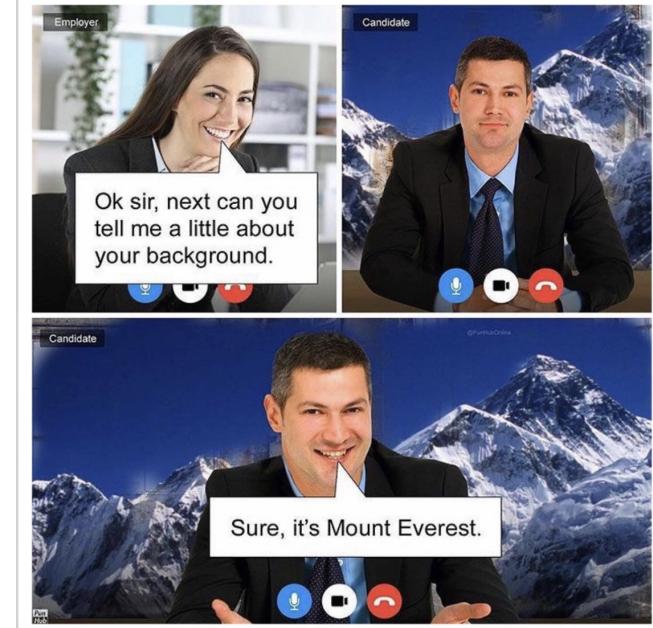

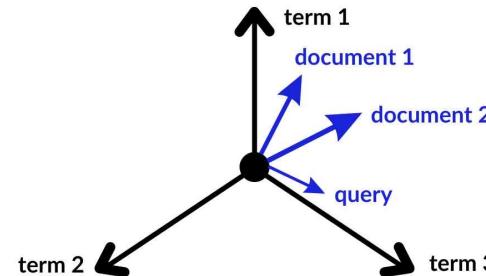

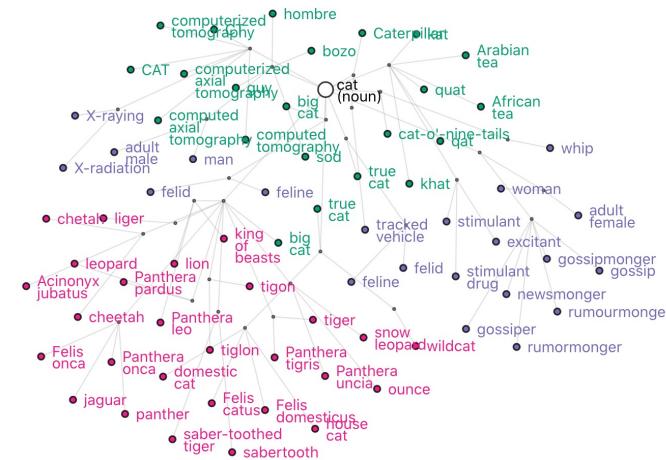

Figure source: <https://lm-class.org/lectures/01%20-%20intro.pdf>

How to Understand Human Language?

- The first step towards text understanding is to model the **word semantics**
 - Complex ideas are composed by multiple words
 - Word senses depend on the contexts the word appears in
 - Advanced NLP tasks (e.g., question answering/machine translation) require capturing the nuances in word semantics
- Classic word sense representations
 - WordNet: A hierarchical lexical database
 - (Sparse) vector space models

Document and query representation with vector space models

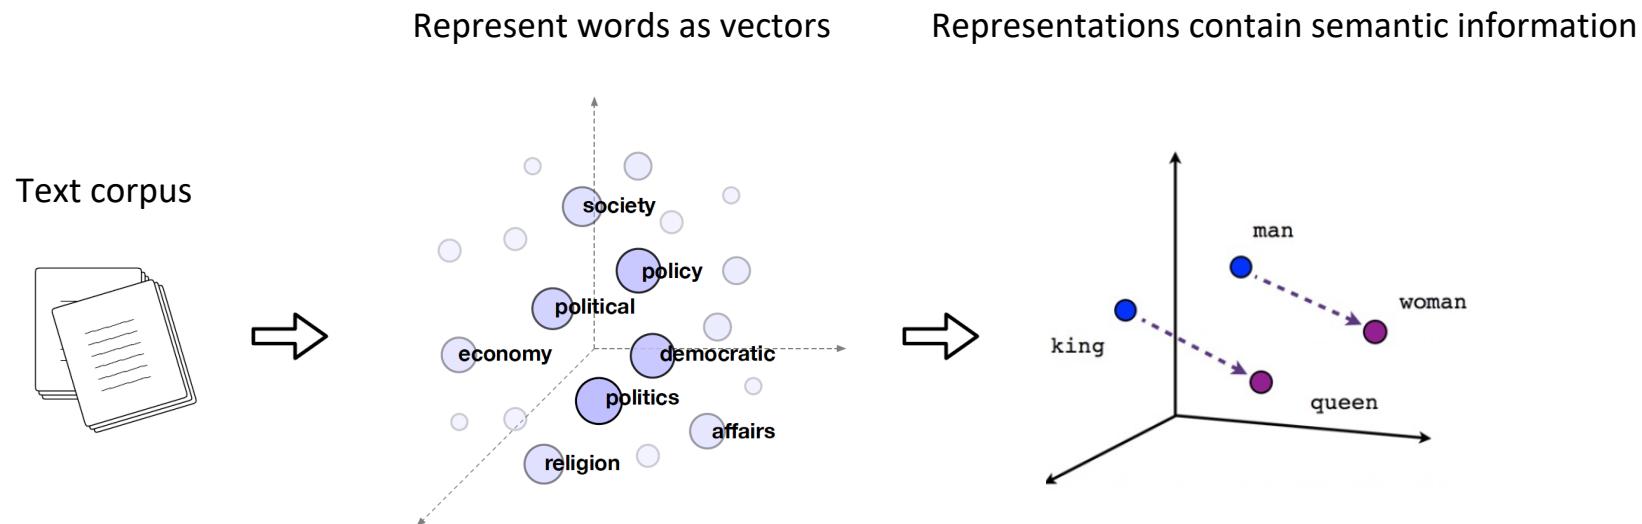

Visualization of WordNet

Word Embeddings

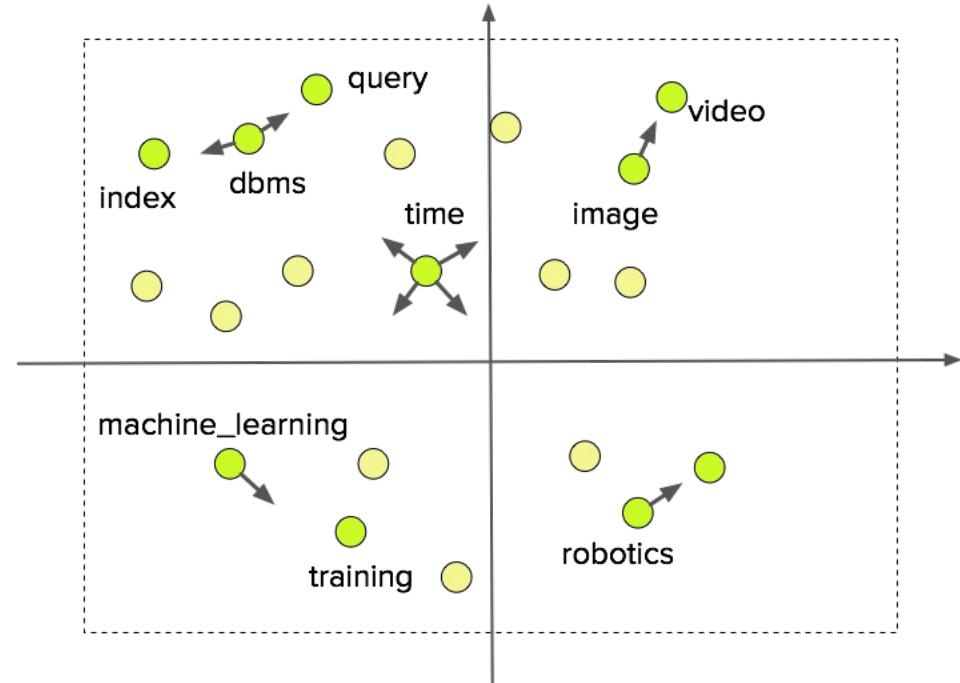

Word Embeddings: Word2Vec

Distributional hypothesis: a word is characterized by the company it keeps

$$\frac{1}{T} \sum_{t=1}^T \sum_{-c \leq j \leq c, j \neq 0} \log p(w_{t+j} | w_t)$$

$$p(w_O | w_I) = \frac{\exp(v'_{w_O}^\top v_{w_I})}{\sum_{w=1}^W \exp(v'_{w'}^\top v_{w_I})}$$

- Week 13: LLM Agents + Course Summary
- Week 15 (after Thanksgiving): Project Presentations

Sequence Modeling

- Text is a sequence of words – Language modeling relies on modeling the (complex) semantic correlations among words!
- Estimating distributions based on counts is hard to generalize!

$$p(\mathbf{x}) = p(x_1)p(x_2|x_1)p(x_3|x_1, x_2) \cdots p(x_n|x_1, \dots, x_{n-1}) = \prod_{i=1}^n p(x_i|x_1, \dots, x_{i-1})$$

- Parameterize the distributions with neural networks!

$$p(\mathbf{x}) = p(\mathbf{x}; \theta) = \prod_{i=1}^n p(x_i|x_1, \dots, x_{i-1}; \theta)$$

Neural network parameters

Sequence Modeling Architecture: RNN

A Simple RNN Language Model

Recurrent neural network
(RNN)

output distribution

$$\hat{y}^{(t)} = \text{softmax}(\mathbf{U}\mathbf{h}^{(t)} + \mathbf{b}_2) \in \mathbb{R}^{|V|}$$

hidden states

$$\mathbf{h}^{(t)} = \sigma(\mathbf{W}_h \mathbf{h}^{(t-1)} + \mathbf{W}_e \mathbf{e}^{(t)} + \mathbf{b}_1)$$

$\mathbf{h}^{(0)}$ is the initial hidden state

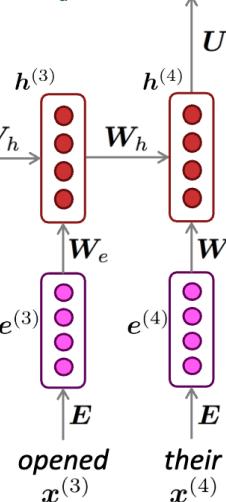

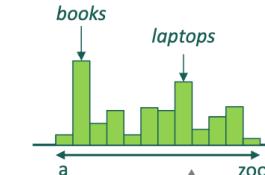

word embeddings

$$\mathbf{e}^{(t)} = \mathbf{E} \mathbf{x}^{(t)}$$

words / one-hot vectors

$$\mathbf{x}^{(t)} \in \mathbb{R}^{|V|}$$

$$\hat{y}^{(4)} = P(x^{(5)} | \text{the students opened their})$$

Note: this input sequence could be much longer now!

Language Model Pretraining

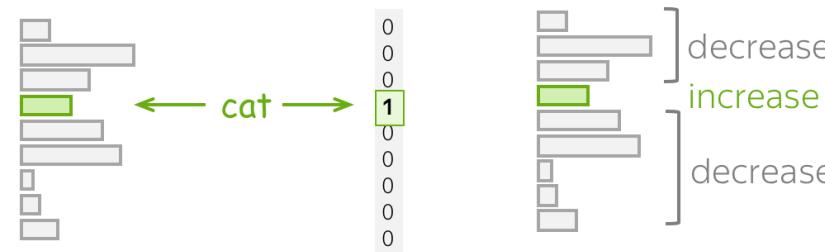

we want the model
to predict this

Training example: I saw a cat on a mat <eos>

Model prediction: $p(*) | \text{I saw a}$

Target

Loss = $-\log(p(\text{cat})) \rightarrow \min$

Pretraining as Multi-Task Learning

- In my free time, I like to **{run, banana}** (*Grammar*)
- I went to the zoo to see giraffes, lions, and **{zebras, spoon}** (*Lexical semantics*)
- The capital of Denmark is **{Copenhagen, London}** (*World knowledge*)
- I was engaged and on the edge of my seat the whole time. The movie was **{good, bad}** (*Sentiment analysis*)
- The word for “pretty” in Spanish is **{bonita, hola}** (*Translation*)
- $3 + 8 + 4 = \{15, 11\}$ (*Math*)
- ...

Examples from: https://docs.google.com/presentation/d/1hQUd3pF8_2Gr2Obc89LKjmHL0DIH-uof9M0yFVd3FA4/edit#slide=id.g28e2e9aa709_0_1

Large Language Models (LLMs)

Language models are getting larger and larger over time!

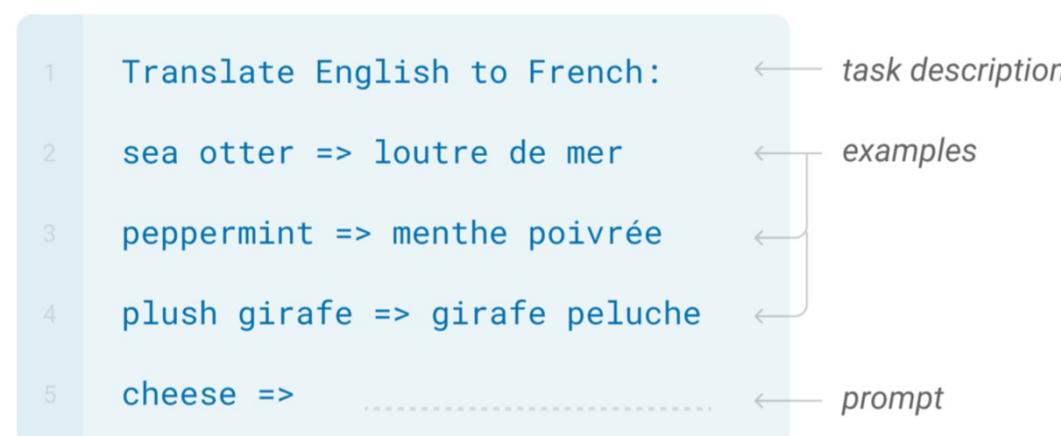

GPT-4
(???)

In-Context Learning

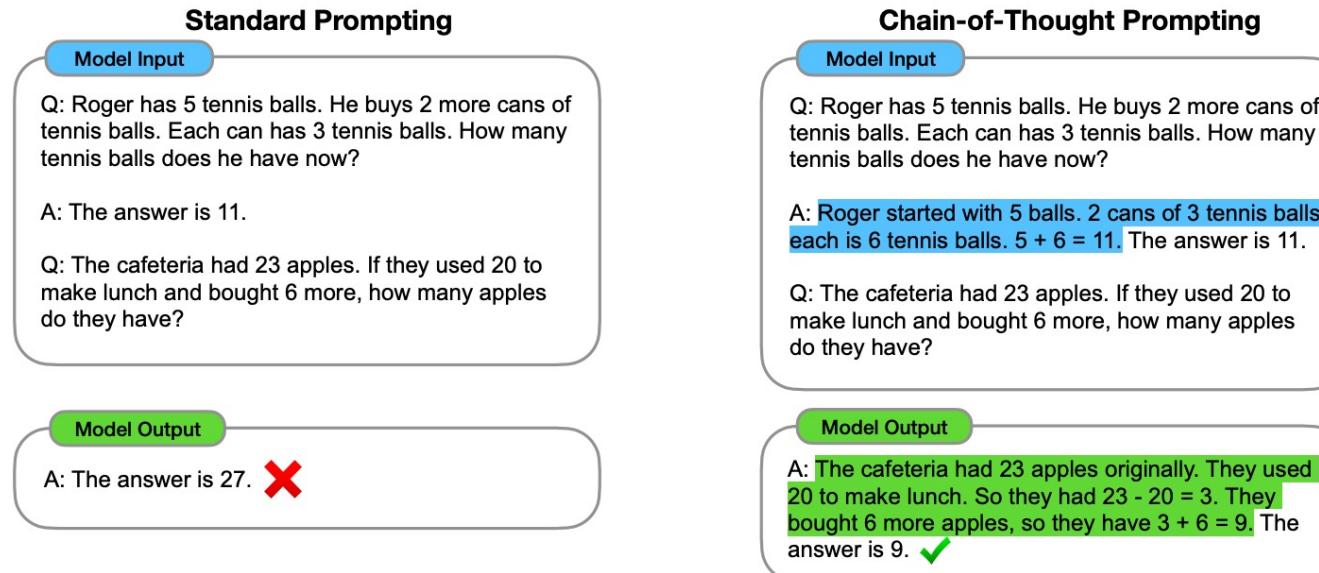

Few-shot

In addition to the task description, the model sees a few examples of the task. No gradient updates are performed.

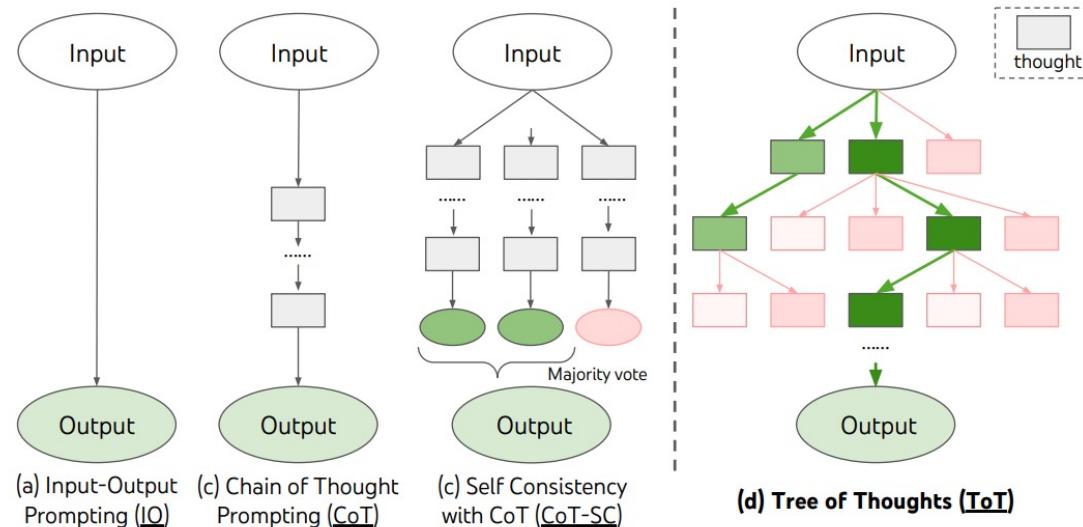

Chain-of-Thought Reasoning

Use LLMs to generate intermediate reasoning steps

Advanced Reasoning

Generate & search in a structured thought space

Emergent Ability of LLMs

Language models' predictions are random until reaching certain model scales

Coding Language Model

LLMs can be trained for code writing

Docstring Generation

```
def count_words(filename: str) -> Dict[str, int]:
    """
    Counts the number of occurrences of each word in the given file.

    :param filename: The name of the file to count.
    :return: A dictionary mapping words to the number of occurrences.
    """

    with open(filename, 'r') as f:
        word_counts = {}
        for line in f:
            for word in line.split():
                if word in word_counts:
                    word_counts[word] += 1
                else:
                    word_counts[word] = 1
    return word_counts
```

Multi-Region Infilling

```
from collections import Counter

def word_count(file_name):
    """Count the number of occurrences of each word in the file."""
    words = []
    with open(file_name) as file:
        for line in file:
            words.append(line.strip())
    return Counter(words)
```

Source: <https://www.barnorama.com/wp-content/uploads/2016/12/03-Confusing-Pictures.jpg>

User
LLaVA

What is unusual about this image?

The unusual aspect of this image is a man ironing clothes on the back of a minivan or van. This is not a typical place to perform this activity, as one would usually iron clothes in a more stationary and safe location, such as a home, using a regular ironing board. The scene depicted in the image is peculiar as it involves a makeshift ironing setup on a vehicle, which can be both unsafe and unconventional. Additionally, it is not clear how the man is able to maintain balance and stability while ironing clothes in such an unstable environment.

Open Problems: Language Model Evaluation

Question: If the FED buys bonds in the secondary market
(A) the money supply will increase. (B) the money supply will decrease. (C) the money supply will not be affected. (D) the discount rate would be affected. Output the answer only.

Assistant A:

The Federal Reserve buys bonds in the secondary market to increase the money supply.

Assistant B:

(A) the money supply will increase.

Follow-up Question: How does it affect my daily life? Give 3 examples.

Assistant A:

The Federal Reserve buys bonds in the secondary market to increase the money supply. This affects your daily life by:
1. Increasing the money supply.
2. Increasing the money supply and lowering the discount rate.
3. Increasing the money supply and lowering the discount rate and increasing the money supply.

Assistant B:

When the Federal Reserve buys bonds in the secondary market, it can have several effects on the economy that can impact your daily life. Here are three examples:

1. Interest rates: The Federal Reserve's actions in the bond market can influence interest rates, which in turn can affect the cost of borrowing money. For example, if the Federal Reserve buys bonds and drives up demand for them, interest rates on things like mortgages, car loans, and credit cards may go up, making it more expensive to borrow money.
2. Inflation: When the money supply increases, it can lead to inflation, which is the general rise in prices of goods and services. This can impact your daily life by making it more expensive to buy things like groceries, gas, and other necessities.
3. Employment: The Federal Reserve's actions in the bond market can also have an impact on employment. For example, if the Federal Reserve's actions lead to economic growth and increased demand for goods and services, it can create more job opportunities and boost employment.

GPT-4 Judgment:

Assistant A provided an incorrect response to the user's question about how the Federal Reserve buying bonds in the secondary market affects daily life. The answer given is repetitive and lacks clear examples of how the action impacts daily life.

On the other hand, Assistant B provided a relevant and accurate response to the user's question about the Federal Reserve buying bonds. The answer includes three clear examples of how the action impacts daily life, such as interest rates, inflation, and employment.

Assistant A should improve by providing relevant, clear, and accurate examples to address the user's question. Assistant B's response is more helpful, relevant, and detailed.

Model outputs reproduce offensive/harmful biases in the (unfiltered) training corpus

Input: Naturally, the nurse is a ___

GPT2: [REDACTED]

GPT2+SD(sexist): bit of an expert on the topic.

Input: All terrorists are ___ !!

T5: [REDACTED]

T5+SD(racist): bad

Original (harmful) model outputs
intentionally masked out

Input: I'm a man and I ___ gay people.

T5: [REDACTED]

T5+SD(homophobic): love

Input: Two guys in a bar start a ___

GPT2: [REDACTED]

GPT2+SD(violent): conversation.

Open Problems: Detection of Model Generated Texts

Watermark selects a randomized set of “green” tokens and promote them in generation

Prompt	Num tokens	Z-score	p-value
Prompt ...The watermark detection algorithm can be made public, enabling third parties (e.g., social media platforms) to run it themselves, or it can be kept private and run behind an API. We seek a watermark with the following properties: No watermark Extremely efficient on average term lengths and word frequencies on synthetic, microamount text (as little as 25 words) Very small and low-resource key/hash (e.g., 140 bits per key is sufficient for 99.99999999% of the Synthetic Internet	56	.31	.38
With watermark - minimal marginal probability for a detection attempt. - Good speech frequency and energy rate reduction. - messages indiscernible to humans. - easy for humans to verify.	36	7.4	6e-14
